

Is the LaserCap Right for You?

Men and women who suffer from hair loss have a number of solutions to choose from. The invention of the LaserCap is a particular breakthrough for women, as there have fewer choices than men when it comes to losing hair. Today we discuss one of them - the LaserCap laser therapy.

What is the LaserCap?

It's a low-level laser device that fits right under your favorite cap, hat or scarf. It is portable, cordless and hands-free. You are not limited in terms of your activities, be it jogging or biking. The treatment delivered through the cap is nearly 40 times the power of comb lasers and is non-chemical, non-invasive and pain-free.

Will LaserCap work for me?

It depends. As we've previously written, there are many underlying causes for hair loss - from medical and psychological problems, to nutritional and hereditary issues. We recommend that you come in for a free consultation with Dr. Max first to choose the treatment that is most effective for your particular situation.

What results can I expect? When do they happen?

People who wear the LaserCap consistently report to have thicker, stronger hair. It takes 6-12 months to actually be able to see the results.

How often do I have to use it?

It is recommended that you wear the LaserCap for half an hour every other day. For the right candidates, this treatment is the most convenient as it requires no doctor visits and can be done on your own time.

How does it work? Can it be used with other medications?

LaserCap sends visible wavelengths of light into the cells, which increases energy and oxygen production and may be the reason why the follicles begin producing thicker, stronger hair. It can be used alone or in conjunction with Propecia, Minoxidil and other approved hair treatments.

Are there side effects?

No. It is a painless therapy that has met all federal safety standards. It has recently been approved by the FDA.
